

INTERVIEW MANAGEMENT SYSTEM

EVIDENCE VAULT MANAGEMENT SYSTEMS

The iRecord **Evidence Vault** creates a secure central repository for all of your digital interview content.

Using the iRecord Evidence Vault, law enforcement agencies can easily manage a large number of recordings involving multiple subjects and multiple interviewers in a user-friendly and intuitive manner.

iRecord records and manages video and audio in two ways. First, an evidentiary master DVD is generated in real time during the interview, and can be secured into evidence immediately at the conclusion of the interview. Second, a working copy of the interview is stored for future playback and retrieval purposes in compressed form using our Evidence Vault Technology which is based on an industry-standard SQL database.

Stored interviews can be easily searched using powerful database evidence vault queries such as key word, case number and suspect name to list a few.

Furthermore, many playback modes are supported such as: Fast forward, rewind, slow motion, and frame-by-frame advance. Users may annotate sessions on a frame-by-frame basis, and search based on annotations. Searching can be done from the main iRecord command center or any authenticated PC desktop in the organization using the iRecord client browser.

User-selected clips are easily exported to DVD for playback in off-the-shelf consumer DVD players, and the audio from an interview can be burned to CD for easy transcription.

iRecord is compatible with existing in-room cameras and microphones. It replaces the existing audiocassette and VCR based systems, and it enhances existing DVD-recorder based systems.
